CF Industries delivers first low-carbon ammonia cargo to Europe

By Edward Laity on Oct 03, 2025

Translate

CF Industries has produced and exported its first shipment of low-carbon ammonia to Antwerp, Belgium, where Envalior will use it in plastics production.

Trafigura purchased 23,000 tonnes of low-carbon ammonia and loaded the cargo on 25 September, acting as the middleman between the two companies.

Certified under the Verified Ammonia Carbon Intensity (VACI) programme, the ammonia will be used to make low-carbon caprolactam – a key chemical used in plastics and ammonium sulphate.

“By integrating certified low-carbon feedstocks into our production of caprolactam/ ammonium sulphate and downstream into PA6, we are showing our commitment to low-carbon materials and helping our customers meet their environmental goals,” explained Envalior’s Thorsten Bredemann.

The blue ammonia was shipped from the CF Industries Donaldsonville complex in Louisiana, the US, which is the central hub of their global operations.

In July, the firm started up its Donaldsonville carbon dioxide dehydration and compression facility to capture and permanently store up to two million tonnes of CO2 annually.

A group of approximately ten men and one woman, dressed in formal business attire, are standing in a line outdoors, participating in a ribbon-cutting ceremony. They are holding a long, thin ribbon that stretches across the frame. In the background, a large white building with the word "ground." and "Italgas" is visible under a clear blue sky. The woman in the center is wearing a green suit and a red sash, while the man on the far right is wearing a dark suit and a green sash.
